Practical 13 Create an HTML page with JavaScript in which a text should move with mouse cursor.

```html
<html>

<head> <title>Example of Mouse Move</title>

        <script type="text/javascript">

        function move()

        {

                tempx = 0;

                tempy = 0;

                var element = document.getElementById("Element");

                document.onmousemove = function getmousexy()

                {

                        if(true)

                        {

                                tempx = event.clientX;

                                tempy = event.clientY;

                        }

                        element.style.marginLeft = tempx;

                        element.style.marginTop = tempy;

                }

        }

        </script>

</head>

<body onload="move()">

        <h3>Kaustubh Wade(160410116050)</h3>

        <div id="Element">

                <h1>Breaking News</h1>

                Your Exam is Postponed

        </div>

</body>

</html>
```
